

LUV BANK

A relationship you can actually see — measure your bond, watch it grow.

Founder one-pager · seeking a co-founder / sponsor

The idea in one line

Luv Bank turns the everyday emotional ups and downs of a relationship into a simple running “account.” Positive moments are deposits, hard moments are withdrawals, and the app quietly builds a picture over time of where the relationship really stands — and which way it’s trending.

It’s built on a proven idea (*the Gottman Institute’s “emotional bank account” and its research-backed 5:1 positive-to-negative ratio*), but no one currently ships it as a simple, personal, self-tracking app. That gap is the opportunity.

The problem & why now

- **People drift.** Couples lose track of how they actually treat each other day to day — small good and bad moments blur, and by the time problems are obvious, they’re hard to fix.
- **Feelings are invisible.** There’s no easy, private way to notice patterns in your own relationship before they become a crisis.
- **The market is real and growing.** Relationship apps are roughly a \$2B market growing ~12–15% a year, and AI is making “personalized relationship insight” newly possible and expected.
- **The Arabic-speaking market is wide open.** Relationship and wellbeing apps are overwhelmingly English-first; very few are built natively for Arabic speakers and right-to-left use. Luv Bank ships fully bilingual, opening a large, underserved MENA audience.

What makes it different

Three established ideas exist separately. Luv Bank is the first to fuse them into one simple consumer product:

Track	Understand	Act
Log emotional moments as quick “transactions” — effortless and private.	A weighted balance + plain-language insight on the trend, grounded in real psychology.	Well-timed nudges and one-tap gestures that turn the insight into action.

Crucially, it’s reframed for 2026: not a scoreboard for blaming a partner, but a private, positive mirror that helps people show up better. That single design choice separates a healthy product from the “keep-score” apps the field now warns against.

Built bilingual from day one

Luv Bank runs fully in English and Arabic, with proper right-to-left layout — not a bolted-on translation. One tap switches the entire experience: the balance, the insights, the nudges, and the sharing flow (the working prototype already does this). That makes it immediately usable across the Arabic-speaking world, where polished, culturally aware relationship tools are scarce — a real product feature and a market wedge at the same time.

One app that adapts — for everyone

It’s a single product covering both positive and negative — the intelligence is in how it **reads the pattern and changes its response**. The ledger is neutral; the app meets each person where they are:

- **Balance high** → it celebrates and nudges you to “pay it forward” before life gets busy.
- **Balance steady** → it prompts one small, deliberate deposit to keep the spark alive.
- **Balance negative** → it shifts to calm support — helps you see the pattern clearly and points toward advice or a trusted person, never bitterness for its own sake.

From feeling to action: smart nudges

The score isn't the end — it drives gentle, well-timed prompts that make the next move easy:

- **Reminders** to reciprocate when you're in credit, or to check in when things dip.
- **One-tap gestures** — send your partner a song, share a joke, plan a small surprise, or say a quick thank-you.
- **Cool-down mode** that, in a heated moment, resurfaces the good — an evidence-based way to soften anger before reacting.

Why it's credible (standing on real science)

- **Gottman Institute** — the “emotional bank account” model and the 5:1 magic ratio give the core mechanic decades of research behind it.
- **Sternberg's Triangular Theory of Love** — a validated, multi-language scale for measuring love across intimacy, passion, and commitment.
- **Joel et al., PNAS (2020)** — machine learning across 43 studies showing relationship quality is genuinely predictable from a few key signals.

What I'm looking for

I'm the originator of the concept and ready to commit. I'm looking for one of the following to take it from idea to real product:

- **A technical co-founder** to build the app and the scoring / insight engine, or
- **A sponsor or early investor** to fund a small team to ship a first version, or
- **A design / growth partner** who can shape the experience and reach the first users.

Next step: a lightweight mobile-first prototype (a PWA) that demonstrates the track → understand → act loop — enough to put in front of real couples and validate. Modest cost, fast to build.
